                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cells
 The present invention describes isolated polynucleotides (PN) comprising a sequence selected from one of 835 nucleotide sequences given in AAA67073 to AAA67907. Heir (reverse) complements, sequences producing an Expectation (E) value of 0.01 or less compared to the 835 sequences, 835 sequences at least 50% identical to them, 200, 100, 40 or 20-mers of the 835 sequences that are degenerately equivalent or allelic to the 835 sequences. The polynucleotides are used to modify the activity of a polypeptide involved in a polysaccharide biosynthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                pathway in the plant. They are especially used to modulate or alter the polysaccharide content, composition or structure of the plant. AAB16268 to AAB16340 are proteins encoded by some of the polynucleotide sequence
                                                                                                                                                                                                                                                                  Eucalyptus grandis; pinus radiata; Monterey pine; modification; plant cell wall; polysaccharide; polysaccharide biosynthetic pathway; transgenic plant; ds.
                                                                                                                                                                                                                                 Eucalyptus grandis alpha-glucosidase DNA sequence SEQ ID NO:197
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New genes encoding proteins involved in a plant polysaccharide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    biosynthetic pathway, useful for modulating or altering the polysaccharide content, composition or structure of the plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 13.2; DB 21; Length 298;

AAA00010 to AAA02716 represent polynucleotides isolated from CDNA libraries constructed from human colon cancer cell lines. The present libraries constructed from human colon cancer cell lines. The present denotine also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in a test sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting differentially expressed genes correlated with a cancerous state of a mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and prognosis of disparent of the contraction of parameters of the contraction of the cell from the prognosic of the cell from the cell fro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pre-metastatic or metastatic cancerous states, stages of cancer, or responsivemess of cancer to therapy). This is particularly for breast cancer, oestrogen receptor-positive breast cancer, oestrogen receptor negative breast cancer, lung cancer, and colon cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

```
acute renal failure, acute nephritis, chronic renal failure, nephrotic syndrome, renal tubule defects, kidney transplants, toxic injury, hypoxic injury and trauma. The compounds are also useful for treating conditions such as neural degeneration where neural growth and regeneration are desirable, e.g., Alzheimer's disease, Parkinson's disease, Huntington's disease, Tourette's syndrome, amyotrophic lateral sclerosis, as well as motor neuron disease, demyelinating disease, bacterial diseases, viral diseases, and prion diseases including Greutzfeldt. Jakob disease. The compounds are also useful for treating disorders due to damage to neural tissue caused by neoplastic impingement, trauma or cerebrovascular events such as hemorrhage or emboli, and neural disorders such as mental retardation, autism, fetal alcohol syndrome, Down's syndrome and cerebral palsy. The present sequence represents an atisense oligo KD2-819 used in the characterisation of genomic clones for RetL5.
                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is the nucleotide sequence of an expressed sequence tag identified during the cloning of human cytokine receptor Zcytor4 cDNA (see AAV5596B). A cDNA containing 110 bp was obtained from human kidney cDNA library. The DNA was transfected into Escherichia coli strain DH10b and the plasmid was designated PSL690°. This has been used to generate probes to examine expression of Zcytor4. The invention provides Zcytor4 polynucleotides (see AAV5596B) and polynucleotides (see AAW80754-56), expression vectors, eukaryotic host cells which express Zcytor4

It was generated by PCR amplification (see AAV55972 and AAV55972) of a human foetal kidney CDNA library. The invention provides human and mouse cytokine receptor Ccytor4 polynuclectides (see AAV55968-69) and polypeptides (see AAW80754-57), expression vectors, eukaryotic host cells which express Ccytor4, chimeric proteins comprising a Ccytor4 polypeptide and an affinity tag, and antibodies that specifically bind Zcytor4. Zcytor4 may play a role in intracellular adhesion and in the regulation or development of haematopoietic cells.

                                                                                                                                                                            haemopoletin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AKS29238 ESS39300 and AAX290816-290925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to mouse and human Ret ligand 5 (RetL5) polypeptides can be expressed by standard recombinant methodology. The RetL5 when bound to Ret, acts as a dimerization or autophosphorylation activator. The polypeptides and their antibodies are useful for stimulating growth of or limiting damage to, Ret expressing tissue in a subject, for suppressing growth of a tumour cell that expresses Ret, for modulating Ret signal transduction involving a cell expressing the Ret polypeptide. The RetL5 polypeptides, fusion proteins containing RetL5 and antibodies are useful for stimulating renal tissue growth and/or survival, supporting renal function and minimizing damage to renal tissue after various insults, particularly for treating
The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NRB genes. The NRB family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences ASIS9300 and AAIS90816-290925 represent specific examples of probe sequences used in the search. Antibodies to the NRB family proteins are used for the diagnosis of blood formation disorders. Compounds identified
                                                                                                                                                                                                                                                                                                                                                                                     as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ret ligand 5; RetL5; autophosphorylation; tumour; renal; nephrotropic; Alzhaimer's disease; Parkhason's disease; Huntington's disease; mouse; vulnerary; nootropic; anti-HTV; neuroprotective; antibacterial; ss; cerebroprotective; hemostatic; antiinflammatory; antiviral; neuroleptic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel Ret ligand polypeptide useful for suppressing growth of a tumor cell that expresses Ret and for modulating Ret signal transduction involving a cell expressing Ret polypeptide or Ret ligand polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;
                                                                                                                        0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AA259288-259300 and AA290816-290925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.
used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.

haemopoletin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser. The sequences AAZ59258-259300 and AAZ90816-280925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.

The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NRB genes. The NRB family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAX59258-559300 and AAX90816-290925 represent specific examples of probe sequences used in the search. Antibodies to the NRB family proteins are used for the diagnosis of blood formation disorders. Compounds identified
                                                                                                                                                                                                                                                                                                                                                           as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NRB genes. The NRB family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser. Ara-Trp-Ser. The sequences AAZ59258-259300 and AAZ90816-290925 represent specific examples of probe sequences used in the search. Antibodies to the NRB family proteins are
                                                                                    Hemopoletin receptor protein family NR8 used for diagnosis of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Hemopoletin receptor protein family NR8 used for diagnosis of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 15;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Haemopoietin receptor family; NRB; antibody; diagnosis; blood formation disorder; fusion protein; probe; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to the isolation of sequences encoding human haemopoletin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AALS9288-259300 and AALS9016-290925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the isolation of sequences encoding human haemopoletin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAAS9238-259300 and AAS90316-290925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosts of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                                                                                                               Gaps
                                  5 Degenerate hybridisation probes (AAT17870-74) are based on a conserved motif (AAR92812) found in haemopoietin receptors. The probes are used in the identification and/or cloning of genes coding for novel haemopoietin receptors, e.g. the murine interleukin-11 (IL-11) receptor alpha chain gene (AAT17868) receptors are defined by their ability to hybridise to the probes under medium stringency conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hemopoietin receptor protein family NRB used for diagnosis of blood
                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                           haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser. The sequences AAZ59258-259300 and AAZ90816-259925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosts of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

/note="Organ: colon; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; 1st strand cDNA was prepared from RER+ colon tumor, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is not normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo (Soares4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cDNA Library Preparation: M. ```
A cDNA library of PHA-activated peripheral blood mononuclear cells in vector pEF-BOS was screened for interleukin-12 (IL-12) receptor cDNAs by panning. An isolated cDNA was sequenced (AAQ83844); it encoded a 662-amino acid low affinity IL-12 receptor (AAR69632). Recombinant IL-12 receptor was expressed in COS cells, and can be used for therapeutic or diagnostic purposes.
                                                                                                                                                                                                                                                                                                                  DNA encoding a low affinity interleukin-12 receptor - used to
bind or scavenge IL-12 to cause immune suppression, e.g. to
suppress graft-vs-host reaction, allograft rejection or
inflammation, and to treat autoimmune conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 2104 BP; 411 A; 624 C; 658 G; 411 T; 0 other;

The present invention specifically describes recombinant swinepox virus (SPV) comprising a foreign DNA (I) inserted into a SPV CC genome which is capable of being expressed in a cost call into which the virus is introduced, where (I) is inserted into:

(a) an EcoRI site within a region corresponding to a 3.2 kb subfragment of the HindIII K fragment which contains both a HindIII and an ECORI site, of the SPV genome, and optionally (b) an AccI site within a region corresponding to a 3.6 kb HindIII we be used in a vaccine for immunising an animal against SPV. The invention also provides a method for testing a corresponding to a 3.6 kb HindIII to BgIII subfragment of the HindIII M fragment. The recombinant SPV can be used in a vaccine for immunising an animal against SPV. The invention also provides a method for testing a content, particularly containing S-SPV-008, or is infected with a content of determine whether the swhne has been vaccined with a courring wild-type pseudorabies virus. Also (I) inserted into containing SPV can be used in a diagnostic assay, e.g. Feline immunications and Dirofilaria immitis contained by and 22kd are useful to detect feline immunodeficiency caused by FIV can be immitis respectively.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Pc portion (e.g. AA224802) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 95 novel genes and their fragments (nucleic acid sequences: AA224811-224907; amino acid sequences AAY41308-Y41404) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 95

CDNA molecules encoding proteins involved in exocytosis have been isolated by yeast one-hybrid and two-hybrid screening. Novel proteins, termed Exo proteins, have been identified that interact with known exocytosis-associated proteins such as GS27, alpha snap, uncl8-1, vamp3, snap-23, and the rab family of proteins. Exo proteins and their agonists and antagonists are useful in the diagnosis, treatment or prevention of exocytosis-mediated disorders such as asthma, inflammation, allergies, Chediak-Higashi Syndrome (CHS), Alzheimer's disease, Parkinson's disease, Huntington's disease,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        represent nucleotide sequences encoding human breast, gastric and prostate cancer associated antigen precursors (CARP) respectively. AAB63202 to AAB63467, AAB63468 to AAB63721 and AAB63722 to AAB63970 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPS have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 condition characterised by expression of an abnormal amount of a protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human gastric cancer associated antigen nucleotide sequence SEQ ID:312.

The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NRB genes. The NRB family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZ59288-253300 and AAZ992816-290925 represent specific axamples of probe sequences used in the search. Antibodies to the NRB family proteins are used for the diagnosis of blood formation disorders. Compounds identified
                                                                                                                                                                                                                                                                                                                                       as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence invention describes ribozymes targeted to modulate the synthesis and/or expression of interleukin (IL)-2R gamma encoded RNA. AAV93889 to AAV94574 represent specifically claimed ribozymes, and AAV94575 to AAV95260 represent specifically claimed substrate sequences from the present invention. The ribozymes can be used for the treatment of, e.g. graft rejection, autoimmune disease, cancer, psoriasis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; IL-2 receptor g-chain; interleukin 2 receptor gamma chain; hammerhead ribozyme; hairpin ribozyme; substrate; expression; cancer; autoimmune disease; psoriasis; allergy; inflammatory disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially parched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AALS9288-259300 and AAS90816-299025 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosts of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AALS9258-259300 and AA290816-290925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hemopoletin receptor protein family NR8 used for diagnosis of blood formation disorders -
                                    5 Degenerate hybridisation probes (AAT17870-74) are based on a conserved motif (AAR92812) found in haemopoietin receptors. The probes are used in the identification and/or cloning of genes coding for novel haemopoietin receptors, e.g. the murine interleukin-11 (IL-11) receptor alpha chain gene (AAT17868) receptors are defined by their ability to hybridise to the probes under medium stringency conditions.
                                                                                                                                                                                                                                                                                     .

                                                                                                                                               haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZ59258-Z59300 and AAZ90815 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified
                                                                                                                                                                                                                                                                                                                                    as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
Hemopoietin receptor protein family NR8 used for diagnosis of blood formation disorders - \,
                                                                                                                              The invention relates to the isolation of sequences encoding human

Lambda ZAP II cDNA library was constructed from mRNA extracted from etiolated leaf tissue of the rice cultivar 'IR36' and converted to pBluescript (amp resistant) as described in Causse et al. (1994) Genetics 138:1251-1274. For insert amplification, Use MI3 forward and reverse
